

Handout for demonstration of GREET net

The objective of this document is to provide a step by step instructions for creating a simple pathway in GREET, and if time allows a new vehicle.

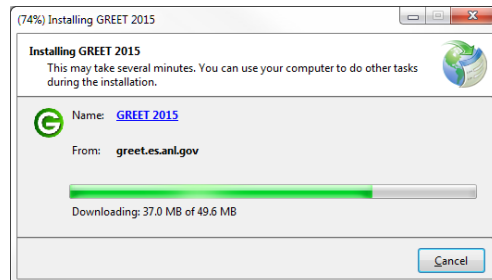

The example we'll be using is the Activated Carbon pathway, which already exists in GREET, but we'll create a duplicate of that pathway for instruction purposes.

Step 1. Installation of GREET.net 2015 (you can skip to Step 2, if you've GREET installed in your PC)

- 1.1. Go to the website <https://greet.es.anl.gov/greet/>.
- 1.2. Click the link "Download the new GREET 2015 software" that downloads the "greet.application" file.
- 1.3. Double click "greet.application" file to start the installation process:

- 1.4. Click the "Install" button:

- 1.5. GREET.net 2015 should then automatically start:

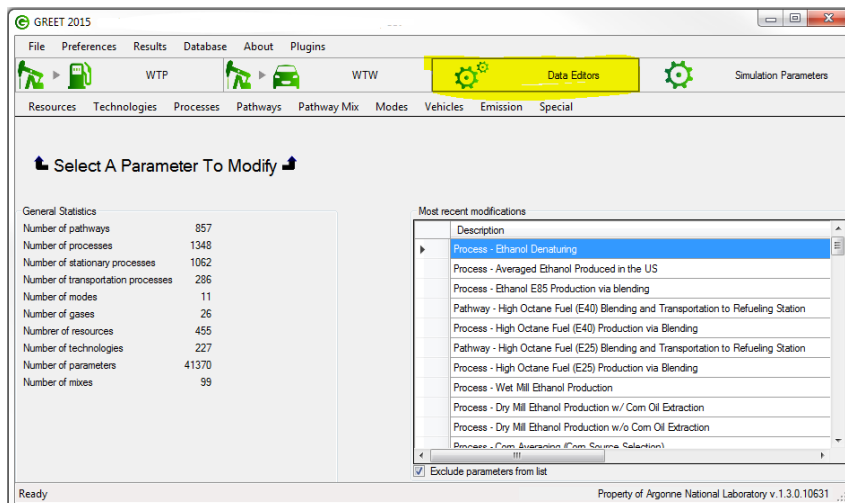

You may need to install the .Net 4.5 Framework on your computer:

<http://www.microsoft.com/en-us/download/details.aspx?id=30653>

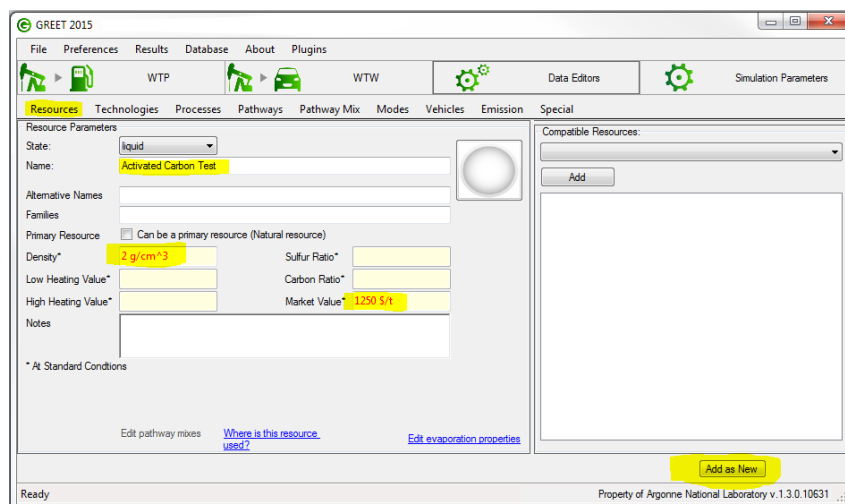

Step 2. Create a new resource and provide a name for it, e.g., “Activated Carbon Test”

2.1. In the main window of GREET.net, click “Data Editors”

2.2. Click the “Resources” menu and select “Add Resource”. Then enter the following attributes:

Name: “Activated Carbon Test” Density: 2.0 g/cm³ Market Value: 1250\$/t

2.3. Click the button “Add as New”. This will add your newly created resource “Activated Carbon Test” to the database. (In order to save it to the data file, please click the “File” menu, then “Save”).

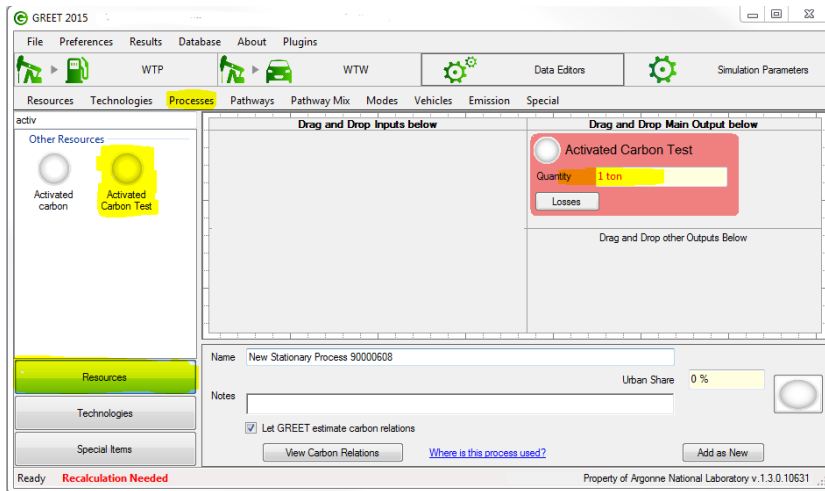

Step 3. Create a new stationary process and provide a name for it, e.g., “Production of Activated Carbon Test”

3.1. In the main window of GREET.net, click “Data Editors” (same as Step 2.1)

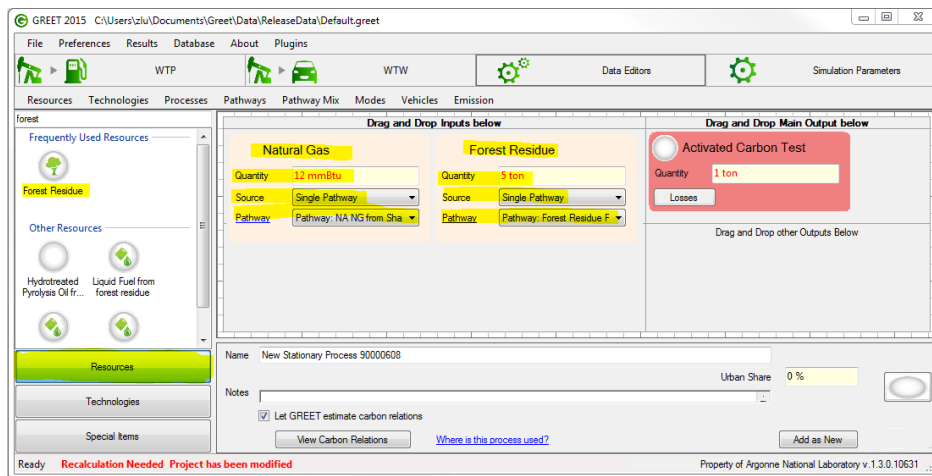

3.2. Click the “Processes” menu and select “Add Stationary Process” to open the stationary process editor.

3.3. Click the “Resources” tab at the lower left corner of the GREET form to display the available resources.

- 3.4. Find “Activated Carbon Test” and drag & drop it into the upper right “Main Output” panel. Enter the “Quantity”, which is the amount of the output of this process in the adjacent textbox (e.g., 1 ton).

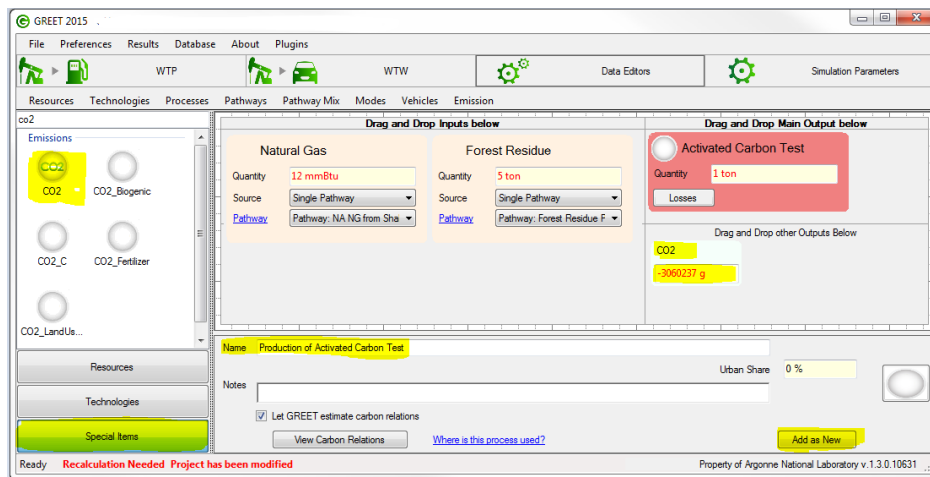

- 3.5. Find “Natural Gas” and drag & drop it into the middle “Inputs” panel. Enter or set the following information:
Quantity: 12 mmBtu Source: Single Pathway
Pathway: NA NG from Shale and Regular Recovery as Stationary Fuels
- 3.6. Find “Forest Residue” and drag & drop it into the middle “Inputs” panel. Enter or set the following information:
Quantity: 5 ton Source: Single Pathway
Pathway: Forest Residue Production for Ethanol plant

- 3.7. Click the “Special Items” tab at the lower left corner to bring up the special emission items. Find “CO₂” and drag & drop it into the middle right “Other Output” panel. Enter “-3060237 g”.
- 3.8. Rename the process (i.e., “Production of Activated Carbon Test”).

Commented [a1]: You need to mention here what is this credit for.

- 3.9. Click the button “Add as New”. This will add your newly created stationary process “Production of Activated Carbon Test” to the dataset. (In order to save it to the data file, please click the “File” menu, then “Save”).

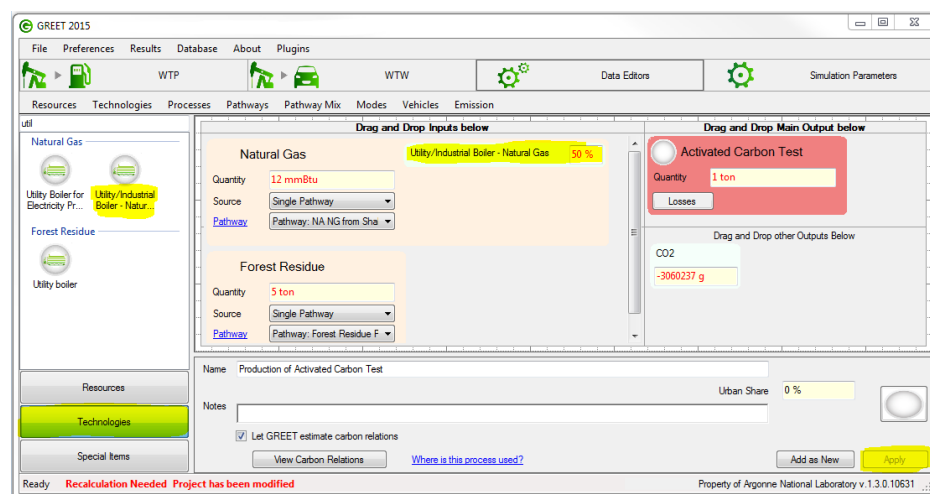

Step 4. Add the technology named “Utility/Industrial Boiler–Natural Gas” to the “Natural Gas” input you previously added to this process

- 4.1. Click the “Technologies” tab at the lower left corner to display the available technologies.
- 4.2. Find “Utility/Industrial Boiler–Natural Gas” and drag & drop it into the “Natural Gas” input in the middle panel.
- 4.3. Enter the technology share of “50%” for technology “Utility/Industrial Boiler–Natural Gas”.

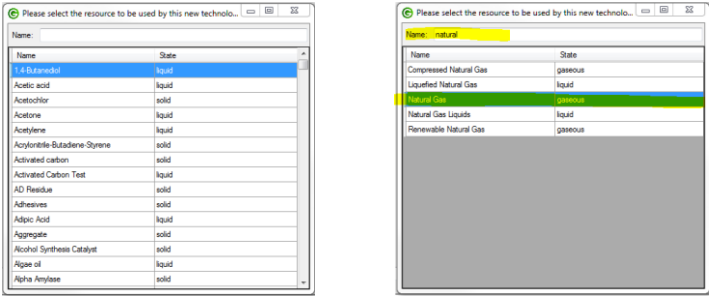

In Step 5, we will create a new technology and add it to the “Natural Gas” input of this process. That technologies will contribute to the remaining 50% technology share.

- 4.4. Click the button “Apply”. This will save your changes to this stationary process “Production of Activated Carbon Test” to the database. (In order to save your changes to the data file, please click the “File” menu, then “Save”).

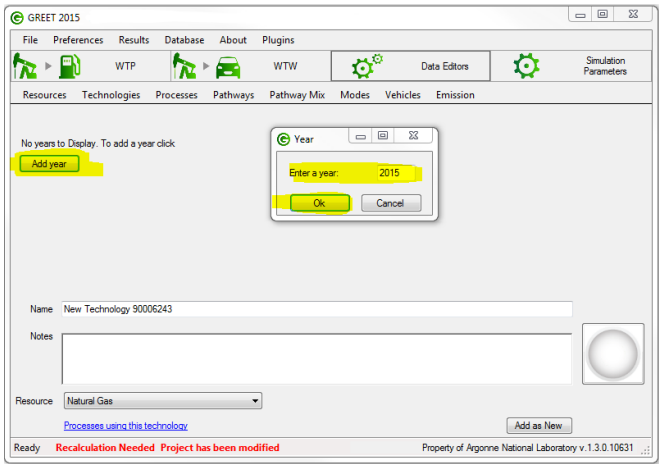

Step 5. Create a new technology “NG Boiler for Activated Carbon Production” and add it to the process “Production of Activated Carbon Test”

- 5.1. In the main window of GREET.net, click “Data Editors” (same as Step 2.1)
- 5.2. Click the “Technologies” menu and select “Add Technology”.
- 5.3. In the popup resource selection window, find “Natural Gas” and double click it to open the technology editor.

- 5.4. Click the “Add year” button and type in “2015” then hit “Ok”.

- 5.5. From the dropdown window, select and add the following emissions one by one. Enter the emission factors for all emissions except for SO_x and CO₂.

Add year	2015	X
VOC	2.54 g/mmBtu	
CO	24.97 g/mmBtu	
NOx	41.05 g/mmBtu	
PM10	3.507 g/mmBtu	
PM2.5	3.507 g/mmBtu	
SOx	0 kg/l	
CH4	1.06 g/mmBtu	
N2O	0.35 g/mmBtu	
CO2	0 kg/l	
BC	0.578655 g/mmBtu	
POC	1.5 g/mmBtu	
Add Emission		

- 5.6. Right click the emission factor numbers of SO_x and CO₂, and select “Switch to calculated values”. Emission factors for these two species will be automatically calculated based on the sulfur and carbon content of the fuel (i.e., Natural gas in this case)

Add year	2015
VOC	2.54 g/mmBtu
CO	24.97 g/mmBtu
NOx	41.05 g/mmBtu
PM10	3.507 g/mmBtu
PM2.5	3.507 g/mmBtu
SOx	0 kg/l
CH4	1.06 g/mmBtu
N2O	0.35 g/mmBtu
CO2	0 kg/l
BC	0.578655 g/mmBtu
POC	1.5 g/mmBtu

Add year	2015
VOC	2.54 g/mmBtu
CO	24.97 g/mmBtu
NOx	41.05 g/mmBtu
PM10	3.507 g/mmBtu
PM2.5	3.507 g/mmBtu
SOx	0.268565615551647 g/mmBtu
CH4	1.06 g/mmBtu
N2O	0.35 g/mmBtu
CO2	59362.6123800525 g/mmBtu
BC	0.578655 g/mmBtu
POC	1.5 g/mmBtu

- 5.7. Rename the technology (i.e., “NG Boiler for Activated Carbon Production”).
- 5.8. Click the button “Add as New”. This will add your newly created technology “NG Boiler for Activated Carbon Production” to the database. (In order to save it to the data file, please click the “File” menu, then “Save”).

Name NG Boiler for Activated Carbon Production

Notes

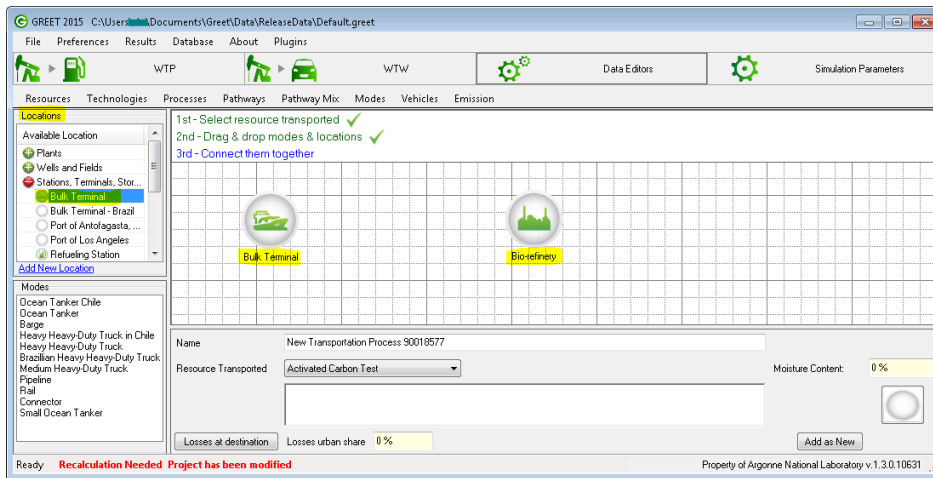

Resource Natural Gas

Processes using this technology

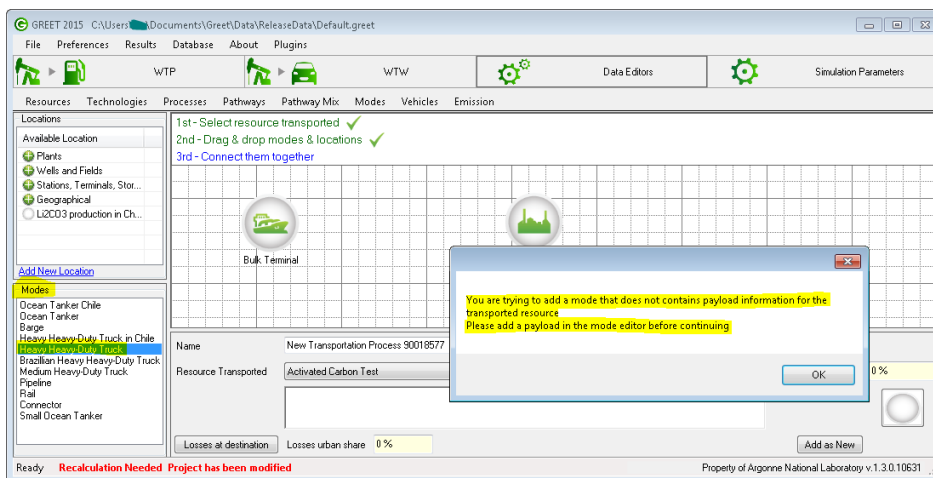

Add as New

Ready Recalculation Needed Project has been modified Property of Argonne National Laboratory v.1.3.0.10631

- 5.9. Reopen the stationary process “Production of Activated Carbon Test” by clicking “Data Editor” ==> “Processes” ==> “Modify Process”. In the popup process selection window, find “Production of Activated Carbon Test” and double click it to open the stationary process in editing mode.
- 5.10. Repeat Step 4 to add newly created technology “NG Boiler for Activated Carbon Production” to the input “Natural Gas” in the middle panel.
- 5.11. Enter the technology share of “50%” for technology “NG Boiler for Activated Carbon Production”.
- 5.12. Click the button “Apply”. This will save your changes to the existing stationary process “Production of Activated Carbon Test” to the database. (In order to save your changes to the data file, please click the “File” menu, then “Save”).

- 6.5. From the lower left “Modes” panel, drag & drop transportation mode “Heavy Heavy-Duty Truck” to the main working panel. There will be a message box prompting to add a payload for “Activated Carbon Test” (because “Activated Carbon Test” is a new resource we create, there is no payload information for it in the database).

- 6.6. Click “OK”. In the popped up “Mode Parameter Editor”, click “Add Payload” button, select “Activated Carbon Test”, and enter the payload of “23 ton”. Click the “Apply” button to save your changes in the transportation mode “Heavy Heavy-Duty Truck” to the database. (In order to save changes to the data file, please click the “File” menu, then “Save”). Then you will be sent back to the transportation process editor.

Mode Parameter Editor

General Parameters
 Name: Heavy Heavy-Duty Truck
 Mode Type: Truck

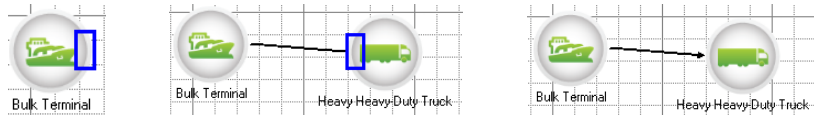

Mode Specific Parameters
 Fuel Economy To: 5.3 mi/gal
 Fuel Economy From: 5.3 mi/gal

Resource	Payload	Action

 Conventional Diesel
 Pathway Mix: Pathway: Conventions 100 %

Buttons: Add as New, Apply

- 6.7. From the lower left “Modes” panel, drag & drop transportation mode “Heavy Heavy-Duty Truck” again to the main working panel. It would be visually better to place mode “Heavy Heavy-Duty Truck” between the two locations “Bulk Terminal” and “Bio-refinery”.
- 6.8. Move the mouse to the right edge of “Bulk Terminal” until a blue rectangle is shown. Click and drag the mouse to the left edge of “Heavy Heavy-Duty” Truck until another blue rectangle is shown. Release the mouse to make a connection between “Bulk Terminal” and “Heavy Heavy-Duty Truck”.

- 6.9. Repeat Step 6.8 to make a connection between “Heavy Heavy-Duty Truck” and “Bio-refinery”.
- 6.10. Double click the mode “Heavy Heavy-Duty Truck”. In the popped up window “Heavy Heavy-Duty Truck mode parameter”, enter the following information, and click the “Apply” button.
 Distance: 50 mi Share: 100% Urban Share: 0%
 Fuel Share: Default Account for backhaul travel: checked

Selected Fuel Share
 Pathway - Conventional Diesel from Crude Oil for US Refineries
 100 %

Buttons: Apply

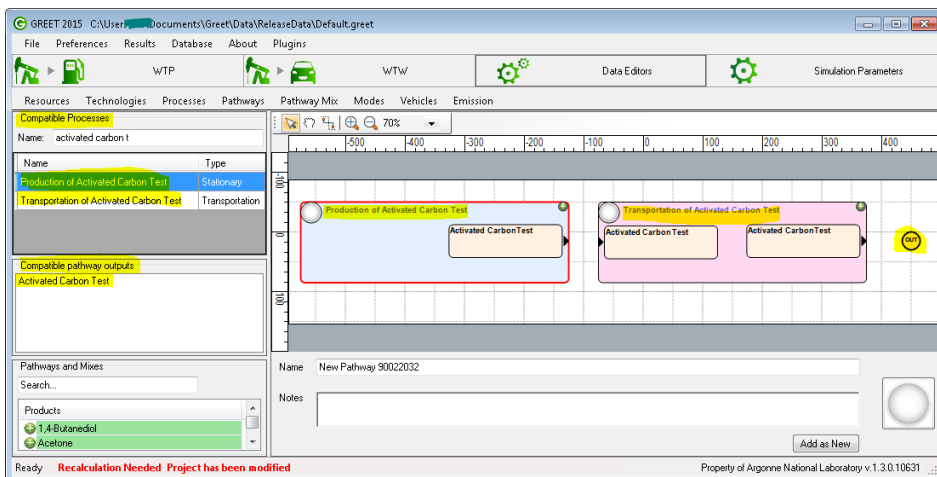

- 6.11. Rename the transportation process (i.e., “Transportation of Activated Carbon Test”).

- 6.12. Click the button “Add as New”. This will add your newly created transportation process “Transportation of Activated Carbon Test” to the dataset. (In order to save it to the data file, please click the “File” menu, then “Save”).

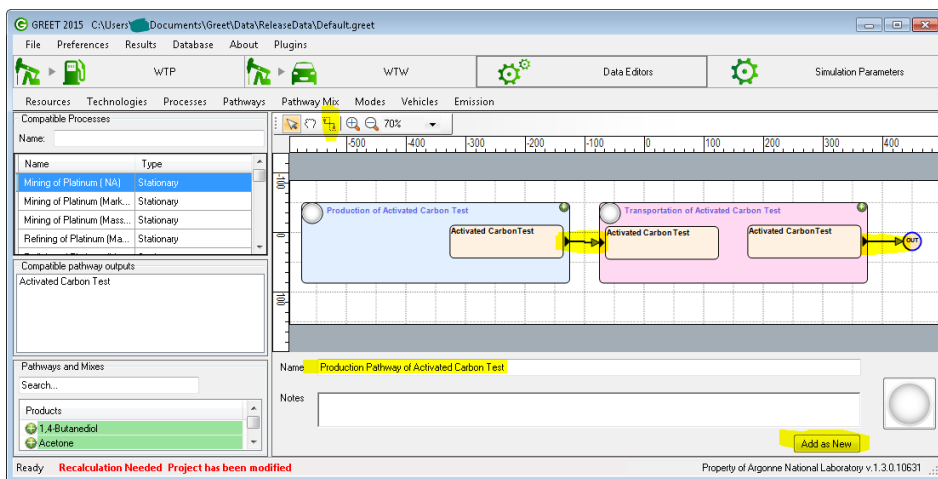

Step 7. Create a new pathway “Production Pathway of Activated Carbon Test” from the two processes you created above

- 7.1. In the main window of GREET.net, click “Data Editors” (same as Step 2.1)
- 7.2. Click the “Pathways” menu and select “Add Pathway” to open the pathway editor.
- 7.3. In the upper left “Compatible Process” panel, find the newly created stationary process “Production of Activated Carbon Test”. Drag & drop it to the main working panel.
- 7.4. Repeat Step 7.3 to drag & drop the newly created transportation process “Transportation of Activated Carbon Test” to the main working panel.
- 7.5. In the middle left “Compatible pathway outputs” panel, drag & drop output “Activated Carbon Test” to the main working panel.

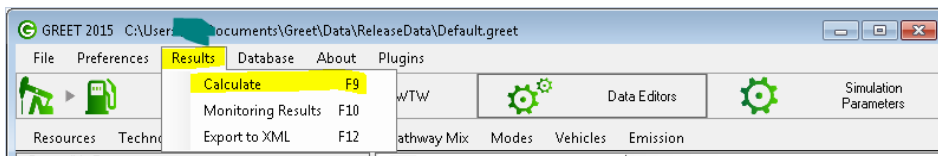

- 7.6. Select the “Connector” icon (the third icon on the upper left corner of the main working panel, see figure below). Connect the output “Activated Carbon Test” of the stationary process “Production of Activated Carbon Test” to the input “Activated Carbon Test” of the transportation process “Transportation of Activated Carbon Test”. Connect the output “Activated Carbon Test” of the transportation process “Transportation of Activated Carbon Test” to the pathway “OUT” icon.
- 7.7. Rename the pathway (i.e., “Production Pathway of Activated Carbon Test”).
- 7.8. Click the button “Add as New”. This will add the newly created pathway “Production Pathway of Activated Carbon Test” to the database. (In order to save it to the data file, please click the “File” menu, then “Save”).

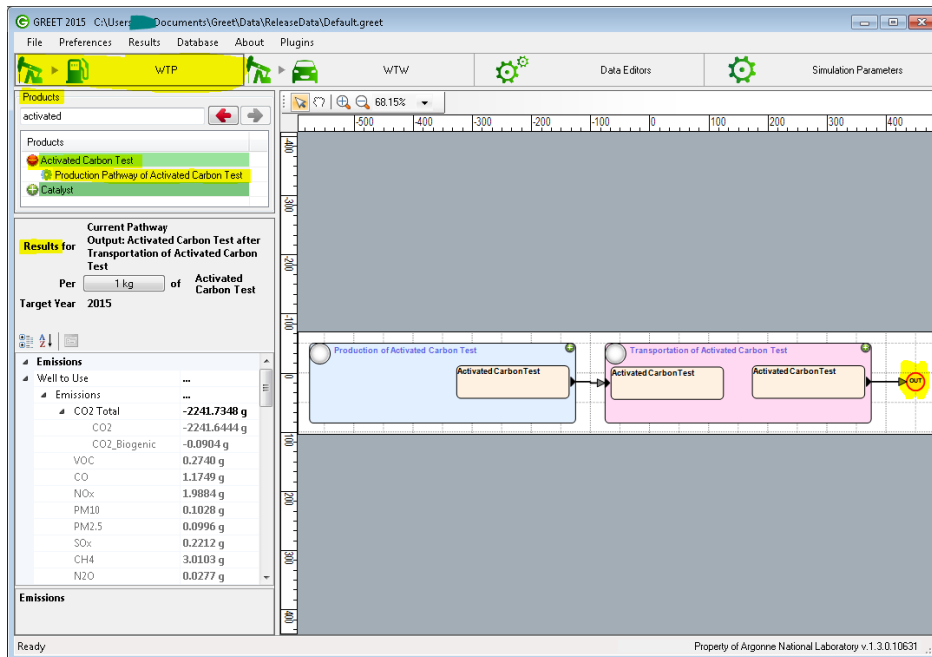

Step 8. Calculate and view WTP results of the newly created pathway “Production Pathway of Activated Carbon Test”

- 8.1. Run the simulation by either clicking the “Results” ==> “Calculate” or by pressing “F9”.

- 8.2. Wait until the calculation indicator disappears.
- 8.3. In the main window of GREET.net, click “WTP”.
- 8.4. In the upper left “Products” panel, find our newly created pathway “Production Pathway of Activated Carbon Test”.
- 8.5. Click the pathway “Production Pathway of Activated Carbon Test” and it will be shown in the right panel.
- 8.6. Click the “OUT” icon of this pathway to view the detailed WTP results in the lower left “Results” panel.

- 8.7. Change the default functional unit “Per 1 kg” of Activated Carbon Test” to “Per 1 ton” by clicking the “1 kg” button in the lower left “Results” panel. Choose “Use user preference”, unit group “mass”, unit “ton”, and amount “1”. Click “Apply and Close”. Then the WTP results are expressed as per 1 ton production of “Activated Carbon Test”.

The 'Select Functional Unit' dialog box is shown. It has two radio buttons: 'Use default preference' and 'Use user preference'. The 'Use user preference' option is selected. Below the radio buttons, there are three dropdown menus: 'Unit Group' (set to 'mass'), 'Unit' (set to 'ton'), and 'Amount' (set to '1'). An 'Apply and Close' button is at the bottom right.
